AI Automation Portfolio Project

June 2026

A lead management and automation platform for UAE real estate agencies

1 Product Overview

The Real Estate Lead Response and Tracking System is a lead management platform designed for small and mid-sized UAE real estate agencies. The product centralizes lead intake, lead tracking, follow-up management, pipeline visibility, and agent performance monitoring into one dashboard.

The purpose of the system is to help real estate agency owners and managers answer key operational questions quickly, such as which leads need attention, which agents are performing best, which follow-ups are overdue, and how much pipeline value is currently active.

The platform combines a client-facing dashboard with backend automation. The dashboard provides visibility, while the automation layer handles repetitive operational tasks such as lead capture, CRM updates, reminders, and follow-up tracking.

2 Target Customer

The target customer is a small or mid-sized UAE real estate agency.

Typical customer profile:

- 5 to 50 agents
- Receives leads from multiple sources
- Uses WhatsApp, spreadsheets, property portals, or manual tracking
- Struggles with follow-up consistency
- Needs better visibility into lead activity and agent performance

The system is especially useful for agencies that receive leads from Property Finder, Bayut, WhatsApp, website forms, referrals, and manual entry.

3 Problem Statement

Real estate agencies often receive leads from many different sources. These leads may arrive through property portals, WhatsApp messages, website forms, referrals, or manual agent entry.

Without a centralized system, agencies face several problems:

- Leads are forgotten or delayed.
- Follow-ups are missed.
- Managers do not have clear visibility into agent activity.
- Pipeline value is difficult to track.
- Lead sources are not measured properly.
- Reporting depends on manual updates.

This creates lost opportunities. A lead may be valuable, but if it is not contacted quickly or followed up consistently, the agency may lose the client to a competitor.

4 Solution

The solution is a centralized lead response and tracking platform connected to automation.

The system provides:

- A dashboard for high-level visibility
- Lead management with searchable records
- Lead source tracking

- Pipeline tracking
- Follow-up management
- Agent performance reporting
- AI recommendations for urgent actions
- Automation through n8n

The goal is to help agency owners and managers make faster decisions and reduce the chance of missed leads.

5 Core Modules

5.1 Dashboard

The dashboard provides a quick overview of agency performance.

It shows:

- Total leads
- Hot leads
- Appointments scheduled
- Deals closed
- Pipeline value
- Lead source performance
- Recent activity
- AI recommendations

5.2 Lead Management

The lead management module stores all lead records in one place.

Each lead contains:

- Lead name
- Phone number
- Email address
- Property interest
- Budget
- Lead source
- Assigned agent
- Current status
- Notes
- Last contacted date
- Next follow-up date

The Leads page should support search and filtering by status, assigned agent, property type, budget range, and lead source.

5.3 Lead Details

The Lead Details page gives agents and managers a complete view of one lead.

It should include:

- Lead profile information
- Contact information
- Property interest

- Budget
- Assigned agent
- Lead source
- Current status
- Notes
- Last contacted date
- Next follow-up date
- Timeline of interactions

Actions should include calling the lead, sending WhatsApp, sending email, scheduling follow-up, and updating status.

5.4 Pipeline

The pipeline module tracks lead progress across sales stages.

Pipeline stages:

- New Lead
- Contacted
- Viewing Scheduled
- Offer Made
- Closed
- Lost

The pipeline should show both lead count and estimated value per stage.

5.5 Follow-Up Center

The Follow-Up Center tracks all upcoming and missed follow-up tasks.

Sections:

- Due Today
- Overdue
- Upcoming
- Completed

Each follow-up task should include:

- Lead name
- Assigned agent
- Follow-up type
- Due date and time
- Priority
- Status

Actions should include Mark Complete, Reschedule, and Open Lead.

5.6 AI Recommendations

The AI Recommendations module highlights urgent actions for the agency.

Example recommendations:

- Hot leads that have not been contacted
- Overdue follow-ups

- Viewings scheduled soon
- Pipeline value at risk
- Leads requiring manager attention

The purpose of this module is to help users decide what to do next.

5.7 Agent Performance

The Agent Performance module tracks agent-level activity.

Example metrics:

- Leads assigned
- Viewings scheduled
- Deals closed
- Conversion rate

This helps agency managers understand which agents are performing well and where support is needed.

6 Lead Sources

The system should track the source of every lead.

Supported lead sources:

- Property Finder
- Bayut
- Website
- WhatsApp
- Referral
- Manual Entry

Lead source tracking helps agency owners understand which channels generate the most leads and which sources produce the highest-quality opportunities.

7 Automation Layer

The automation layer is powered by n8n.

Example automations:

- When a new lead arrives, create a CRM record.
- When a follow-up is overdue, send a reminder.
- When a lead is created, notify the assigned agent.
- When a lead status changes, update the pipeline.
- When a viewing is scheduled, create a follow-up task.

The automation layer reduces manual admin work and keeps the dashboard updated.

8 Data Layer

For the MVP version, the system can use Google Sheets as the data layer.

MVP data storage:

- Leads sheet
- Pipeline sheet
- Follow-ups sheet
- Agent performance sheet
- Activity log sheet

Future production versions can migrate to:

- Supabase
- PostgreSQL
- A dedicated CRM database

9 Success Metrics

The system should allow an agency owner or manager to answer the following questions within 30 seconds:

- How many leads came in today?
- How many hot leads have not been contacted?
- Which follow-ups are overdue?
- Which agent is performing best?
- Which lead sources are producing the best opportunities?
- How much pipeline value is active?
- How many deals were closed this month?

The main value of the product is reducing operational confusion and decision time. Instead of searching through spreadsheets, WhatsApp chats, and agent updates, managers should be able to open one dashboard and immediately understand the state of the business.

10 MVP Scope

The first working version should include:

- Dashboard
- Leads page
- Lead details page
- Pipeline page
- Follow-Up Center
- AI Recommendations
- Lead Source Analytics
- Agent Performance
- Recent Activity
- Google Sheets data connection
- n8n automation layer

The MVP does not need full authentication, billing, multi-tenant support, or a production database yet.

11 Future Roadmap

Future improvements may include:

- Real WhatsApp integration
- Property portal integration
- AI lead scoring
- AI-generated follow-up messages
- Appointment booking integration
- Agent login accounts
- Manager approval workflows
- Supabase or PostgreSQL backend
- Multi-agency support
- Subscription-based SaaS model

12 Conclusion

The Real Estate Lead Response and Tracking System is designed to help UAE real estate agencies manage leads, follow-ups, pipeline activity, and agent performance in one place.

The product combines dashboard visibility with backend automation. The dashboard helps managers understand the business quickly, while the automation layer reduces repetitive manual work.

The long-term goal is to turn a manual lead management process into a structured, automated operating system for real estate agencies.
